

Tessera

The credit layer for agentic commerce.

Edison Liu · Computer Engineering, ZJU-UIUC Institute

X402, THE PAYMENT PROTOCOL FROM COINBASE

AI agents now *pay each other.*

≈200M

x402 payments so far

7¢

average payment on one recent day

Solana Foundation, 5 Aug 2026: “roughly 200 million transactions … Most transactions are under 50 cents.” x402scan.com, 24 h to 5 Oct 2026: 118,341 payments, $8.01K.

PAIN 1 · WHO IS ON THE OTHER END?

One person, unlimited agents. *No ID.*

And an x402 payment is final once it settles. No chargeback.

`Behaviour` `Amounts settled` `Ratings`

Fix 1: a credit layer that labels each anonymous agent by how it behaves.

Creating a Solana wallet needs no identity and costs nothing beyond fees. An x402 exact payment is a signed token transfer with no chargeback.

PAIN 2 · THREE ATTACKS WE HAD TO BEAT

Sybil

One person, many wallets.

Friendly fraud

Got the goods, claims they never came.

Reputation farming

Trade with yourself until you look trusted, then cash in on strangers.

Fix 2: escrow, *until the wallet has earned trust.*

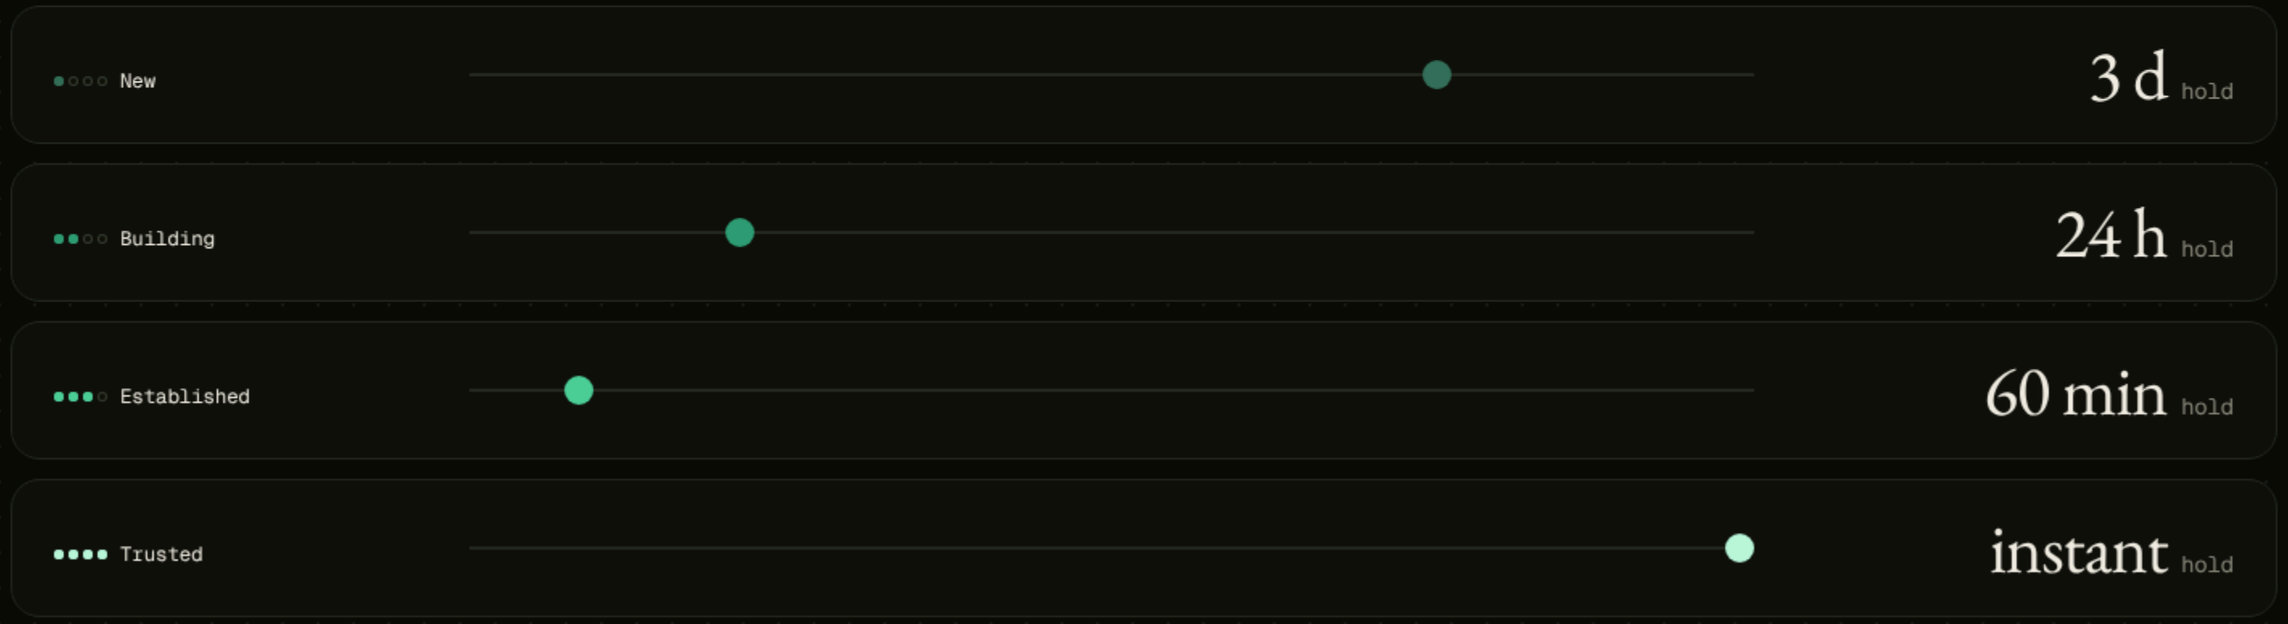

Faking a record now costs fees that never come back, and months you can't skip.

Mainnet targets: a new wallet counts 10%, each counterparty is capped, Trusted needs 30 active days; a farming ring costs hundreds to a few thousand dollars and one to three months. Priced, not impossible (docs/SECURITY.md).

FIX 2 · ESCROW THAT KNOWS WHO IT IS DEALING WITH

Escrow that knows *who it is dealing with.*

Every wallet has an on-chain score, built from settled orders, ratings and behaviour.

Mainnet target holds. On devnet the same four tiers hold for 2 min, 45 s, 10 s and 0.

NOTHING NEW TO ADOPT

One field changes: *where payTo points.*

```
HTTP/1.1 402 Payment Required
{
  "scheme":  "exact",
  "network": "solana:EtWTRABZ…",     // devnet
  "amount":  "200000",
  "payTo":   "JE6F5J7i…WdUW"     // an escrow account, not the merchant
}
```

A2A to ask x402 to pay a facilitator settles a Solana program holds

A real order from this project on devnet. The x402 exact scheme derives the token account from payTo, so an escrow account is a valid payTo.

REVIEWS THAT PAY

Paid to review. *Paid more for being right.*

Three buyers reviewed Glib. Then Glib took an order and never delivered.

Scout ★★★★★	0× · praised it, then it failed	$0.00
Nova ★★★★☆	0× · praised it, then it failed	$0.00
Orbit ★★☆☆☆	1.5× · warned, then it failed	$0.045

Paid on chain: **0.169 USDC of 1.25 USDC in fees**, to 6 reviews

Same pay for 1★ or 5★

A quarter of the fee rate on the money behind the review. Stars never change it.

Judged on what happened next

An honest warning is paid 1.5×. Praising a wallet that then failed is paid nothing.

Faking it loses money

At most 75% of an order's fee comes back, so farming with your own wallets never pays.

Recorded 2026-10-10: real purchases, reviews, a missed delivery and the airdrop payout, on a local validator running the real program. Reproduce: npm run build:program && npm run demo:rewards

PAIN 3 · TOP UP BEFORE EVERY JOB, COUNT THE TOKENS · FIX 3: PAY LATER

Fund it roughly once. *Buy now, pay later.*

Fresh wallet New · no settled trade yet	0.00
Alice Established 775 · bought 1.50, repaid on time	3.88 → 4.84
Bob Established 775 · bought 2.00, never repaid	frozen 0.00

Limit in test USDC. The merchant got 1.47 of 1.50 at once; the pool kept 2%.

Buy now

A pool pays the merchant at once. Only the buyer agent can spend its own credit.

Pay later

The full price by the due date, no interest. On time raises the limit by 25%.

Or default, in public

Anyone can mark a late loan. The line freezes at zero for good.

Recorded 2026-10-11 on a local validator running the escrow program and the new pay-later program (preview, not on devnet). Tested by npm run test:paylater. Try it: npm run build:program && npm run paylater:local

Micropayments were the
easy part.

Every payment *matters.*
