

How Tessera works

One Solana program, two open protocols, and a website
that reads the chain directly.

Five accounts. *Everything else is derived.*

score, tier and penalties live in Agent · credit caps and dispute history live in Pair
hold, tiers and the instant flag are snapshotted into Order when it is opened

THE ONE DESIGN DECISION EVERYTHING RESTS ON

The program trusts a balance, *not a message*.

```
/// Permissionless on purpose: the only input it trusts is the vault balance.
pub fn confirm_funded(ctx: Context<ConfirmFunded>) -> Result<()> {
    let vault_balance = ctx.accounts.vault.amount;
    let order = &mut ctx.accounts.order;
    require!(order.state == OrderState::AwaitingPayment, TesseractError::InvalidState);
    require!(vault_balance >= order.amount, TesseractError::VaultUnderfunded);
    order.state = OrderState::Funded;

    ...
}
```

A facilitator can refuse a payment but cannot redirect one: the buyer's signature fixes recipient, amount and mint. A dishonest merchant server cannot either: the buyer re-derives the escrow address and reads the order from the chain before signing.

programs/tessera/src/lib.rs. A July 2026 study found rule violations in all 15 x402 facilitators it tested (arXiv 2607.19545), which is why nothing here trusts one.

ONE FORMULA, THREE PLACES: PROGRAM, SDK, BROWSER

```
let history  = isqrt(credit * 1_000_000 / credit_full).min(1000);  
let effective = age_periods.min(active_periods * 3);  
let tenure   = (effective * 1000 / tenure_full).min(1000);  
let diversity = (points * 1000 / diversity_full).min(1000);  
  
let evidence = (450 * history + 300 * tenure  
               + 250 * diversity) / 1000;  
  
let score = evidence * rating * behaviour / (1000 * BPS);
```

protocol fees paid	\$0.0125
limit (base + fees)	\$0.5125
not yet accepted by buyers	\$0.0000
eligible	yes

A merchant can take instantly only what it has already paid in fees, plus a small base. That is what bounds an exit scam.

A merchant's credit file. Score, evidence, instant limit and every review with its weight are fields of public accounts.

STACK, AND WHAT IS NOT DONE

Program	Anchor 1.1.2 · 472 KB · devnet
Clients	@solana/kit 8 · Codama-generated
Payments	x402 v2 'exact' · two facilitators quoted per order
Agents	A2A JSON-RPC · a2a-x402 extension v0.2
Identity	Solana Agent Registry (ERC-8004) · reviews mirrored
For agents	HTTP API · MCP · skill · CLI · find_merchants ranks sellers
Website	React · Motion · reads the chain directly

- Devnet only; the demo traffic is our own agents
- Time is compressed 1,440 to 1: a period is a minute, not a day
- The arbiter and the upgrade authority are single keys
- The program is unaudited
- A2A endpoint is hand-rolled, not yet run against the official test kit
