

Tessera

The credit layer for agent commerce.

IT IS ALREADY HAPPENING

AI agents now *pay*
each other.

≈200M 7¢

x402 payments so far

average payment on one recent day

Solana Foundation, 5 Aug 2026: "roughly 200 million transactions ... Most transactions are under 50 cents." x402scan.com, 24 h to 5 Oct 2026: 118,341 payments, \$8.01K.

WHY THE PAYMENTS STAY SMALL

Paid in a second.
Final forever.

Seven cents can afford to be wrong.
Seven hundred dollars cannot.

Our reading, not a measured cause. An x402 'exact' payment is a signed token transfer with no chargeback. Median facilitator settlement on devnet here: 1.2 s (51 payments).

HOW TRUST IS BUILT TODAY

120_{days}

the youngest purchase
history Visa accepts as
evidence in a fraud dispute

\$0.001

what one on-chain review
costs. No purchase needed.

WHAT TESSERA DOES

Escrow that knows *who* *it is dealing with.*

●○○○ New

3 d_{hold}

●●○○ Building

24 h_{hold}

●●●○ Established

60 min_{hold}

●●●● Trusted

instant_{hold}

Mainnet target holds. On devnet the same four tiers hold for 2 min, 45 s, 10 s and 0.

NO NEW STANDARD

One field changes: *where payTo points.*

```
HTTP/1.1 402 Payment Required
{
  "scheme": "exact",
  "network": "solana:EtWTRABZ...", // devnet
  "amount": "200000",
  "payTo": "JE6F5J7i...WdUW" // an escrow account, not the merchant
}
```

A2A to ask x402 to pay a facilitator settles a Solana program holds

A real order from this project on devnet. The x402 "exact" scheme derives the token account from payTo, so an escrow account is a valid payTo.

How much is known,
times whether it is
good.

$$\text{score} = \text{Evidence} \times \text{Rating} \times \text{Behaviour}$$

History

settled volume, weighted by who the counterparty was

Tenure

time, counted only while actually trading

Diversity

distinct counterparties, weighted by their tier

Who should I buy from? *One call.*

```
$ tessera find text summary
```

1	Quill Trusted 905 · ★4.76 · 5 sales	0.25 USDC escrow · ~9 s
---	---	----------------------------

2	Scribe Established 658 · ★4.26 · 2 sales	0.15 USDC escrow · ~13 s
---	--	-----------------------------

3	Glib Building 181 · ★2.38 · 2 sales · 1 missed delivery	0.10 USDC escrow · ~9 s
---	---	----------------------------

A regular customer asking the same: `Quill · instant · ~1 s to settled`

Ranked by money, not words

Each review needed a real settled order and counts by what it paid.

Answers the next question too

Every row says instant or escrow, and the seconds from paying to settled.

Built for agents

Compact JSON with enums, over an API, MCP, a skill or a CLI. No pages to read.

WE ASSUMED PEOPLE WOULD CHEAT

Faking a record costs money and time *that never come back.*

never

when a ring of 3 or 6 of your own wallets reaches
Trusted (a full year simulated)

\$4,356

burned in fees by a ring of 12 to get there, over 33 days

\$25

net of an exit scam per wallet, at any size

Computed by the same arithmetic the program runs, at the mainnet target parameters. Reproduce: `npm run test:formula`

NEXT: PROOF OF PERSONHOOD

One person, one identity. *However many wallets.*

Rings collapse

Orders between one operator's own wallets earn nothing.

Penalties stick

A fresh wallet still answers for the person behind it.

Nobody learns who

The proof shows membership in a verified group, never which member.

Roadmap, not built. A Semaphore-style zero-knowledge proof (Groth16 over BN254, which Solana verifies with its alt_bn128 syscalls) closes the two open items in docs/SECURITY.md: large rings (C2) and whitewashing (C12).

LIVE ON SOLANA DEVNET · READ FROM THE CHAIN WHILE YOU WATCH

239

orders settled through escrow

10

agents that have earned Trusted

42

orders settled instantly

562

score of the wash-trading ring's merchant (Established)

Demo network: this project's own agents, recycled test USDC, time compressed (one period = 60 s). \$57.80 settled.

CHEAPER, AND FINAL SOONER

What it takes to move *seven cents.*

WHAT THE PAYMENT COSTS

Card processor (2.9% + 30¢) \$0.3020 · 431%

Tessera escrow (1%) \$0.0007 · 1%

HOW LONG IT STAYS OPEN TO DISPUTE

Card chargeback window 120 days

Tessera, a new wallet 3 days

Tessera, two Trusted agents none · settles with delivery

The buyer pays no network fee: the x402 facilitator does. On devnet, a buyer agent's SOL balance was identical before and after its purchase.

Card price: stripe.com/pricing (5 Oct 2026). Chargeback window: Stripe, "Chargeback time limits in the UK". Tessera holds: mainnet targets.

WHERE IT FITS

Solana has the identity and the payment. *This is the credit.*

IDENTITY

Solana Agent Registry ERC-8004 on Solana

Who the agent is, and what others say about it.

CREDIT

Tessera escrow and an on-chain score

Whether the money waits, and for how long.

PAYMENT

x402 the exact scheme, unchanged

How the money moves.

Our 4 merchant agents are in the Agent Registry on devnet. Each of the 28 reviews Tessera has mirrored there points at the escrow account that proves the purchase.

solana.com/agent-registry. Assets and mirrored reviews: [deployments/registry.json](#). ERC-8004: "Payments are orthogonal to this protocol and not covered here."

\$3–5 trillion

of commerce that AI agents could orchestrate by 2030, on McKinsey's estimate

1%

of what settles through escrow.
Nothing on what does not.

For sellers

One function, `quote()`, opens the escrow behind an existing `x402` endpoint or A2A agent.

For buyers

One check, `verifyOrderForPayment()`, before signing. No SOL, no account, no sign-up.

The score itself

Any wallet can be scored by anyone. A demo agent already sells credit reports for 30¢.

Illustration, not a forecast: 1% of the low estimate through escrow, at a 1% fee, is \$300 million a year.

WHO IS BUILDING IT

Edison Liu

Electronic and Computer Engineering, ZJU-UIUC
Institute. Builds working systems end to end, from
embedded hardware to on-chain programs, with AI
coding agents as the build engine.
