

Tessera

The credit layer for agent commerce.

IT IS ALREADY HAPPENING

AI agents now *pay*
each other.

118,341 7¢

x402 payments in 24 hours

average payment (\$8,010 in total)

x402scan.com, facilitators, 24 hours to 5 Oct 2026: 118,341 transactions, \$8.01K volume. 85,832 of them through Coinbase's facilitator.

THE GAP

Paid in a second. *Final forever.*

Before an agent pays a stranger, it has
one question: will I get what I paid for?

Median facilitator settlement on devnet in this project: 1.2 s (51 payments). An x402 'exact' payment is a signed token transfer; there is no chargeback.

HOW THE OLD WORLD ANSWERS IT

120_{days}

the youngest purchase
history Visa accepts as
evidence in a fraud dispute

0.05_{SOL}

what ten thousand fake
reviews cost in network fees

Visa Compelling Evidence 3.0: two prior undisputed transactions, 120 to 365 days old (Checkout.com, 30 Oct 2025). Solana base fee: 5,000 lamports per signature.

WHAT TESSERA DOES

Escrow that knows *who* *it is dealing with.*

●○○○ New

3 d_{hold}

●●○○ Building

24 h_{hold}

●●●○ Established

60 min_{hold}

●●●● Trusted

instant_{hold}

Mainnet target holds. On devnet the same four tiers hold for 2 min, 45 s, 10 s and 0.

NO NEW STANDARD

One field changes: *where payTo points.*

```
HTTP/1.1 402 Payment Required
{
  "scheme": "exact",
  "network": "solana:EtWTRABZ...", // devnet
  "amount": "200000",
  "payTo": "JE6F5J7i...WdUW" // an escrow account, not the merchant
}
```

A2A to ask x402 to pay a facilitator settles a Solana program holds

A real order from this project on devnet. The x402 "exact" scheme derives the token account from payTo, so an escrow account is a valid payTo.

How much is known,
times whether it is
good.

$$\text{score} = \text{Evidence} \times \text{Rating} \times \text{Behaviour}$$

History

settled volume, weighted by who the counterparty was

Tenure

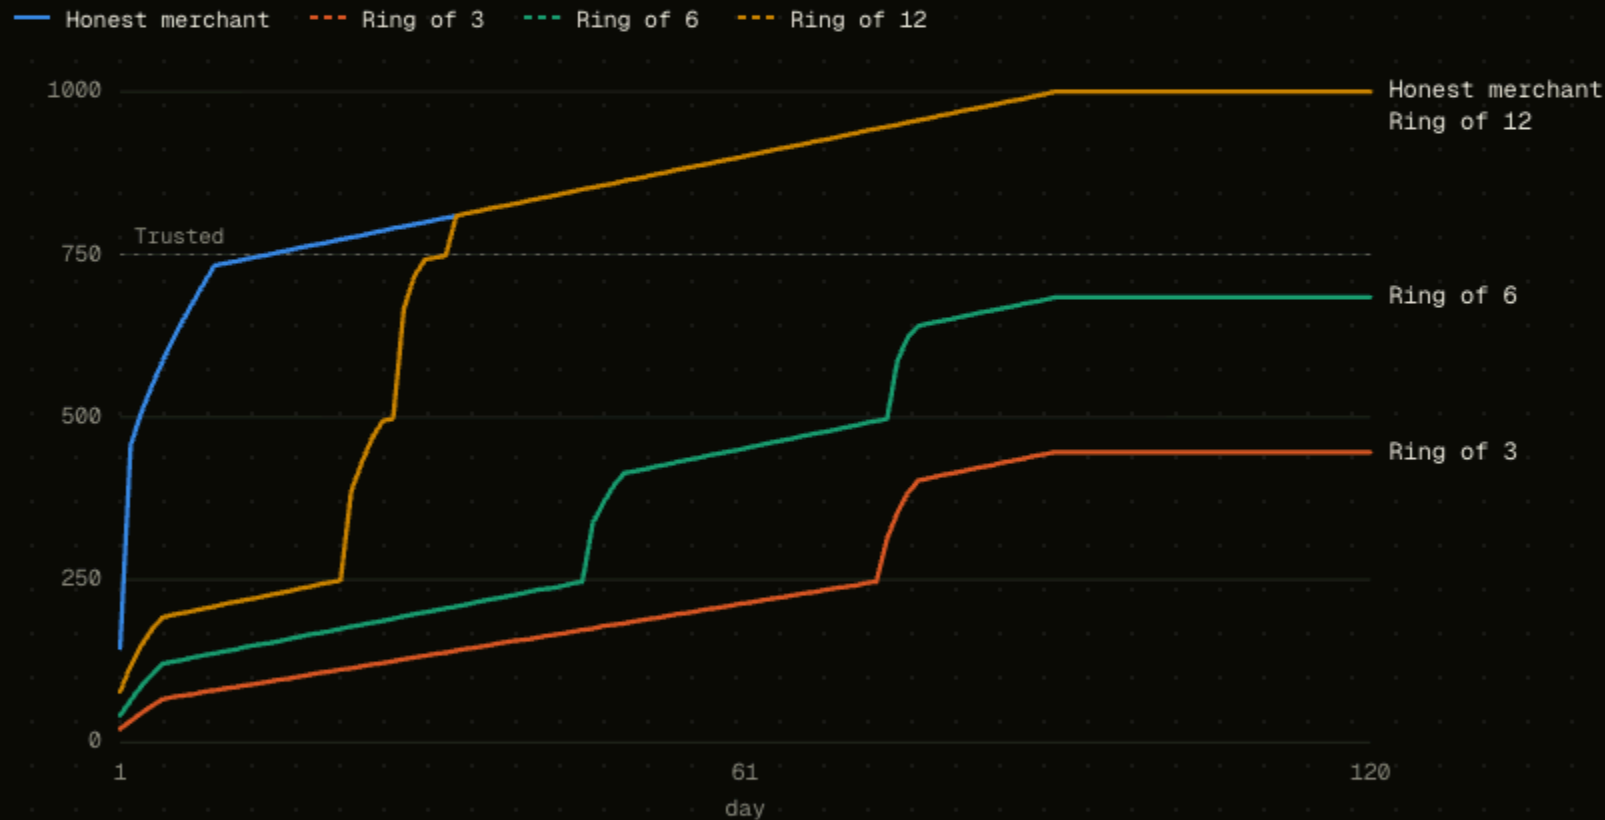

time, counted only while actually trading

Diversity

distinct counterparties, weighted by their tier

WE ASSUMED PEOPLE WOULD CHEAT

Faking a record costs money and time *that never come back.*

never

when a ring of 3 or 6 of your own wallets reaches
Trusted (a full year simulated)

\$4,356

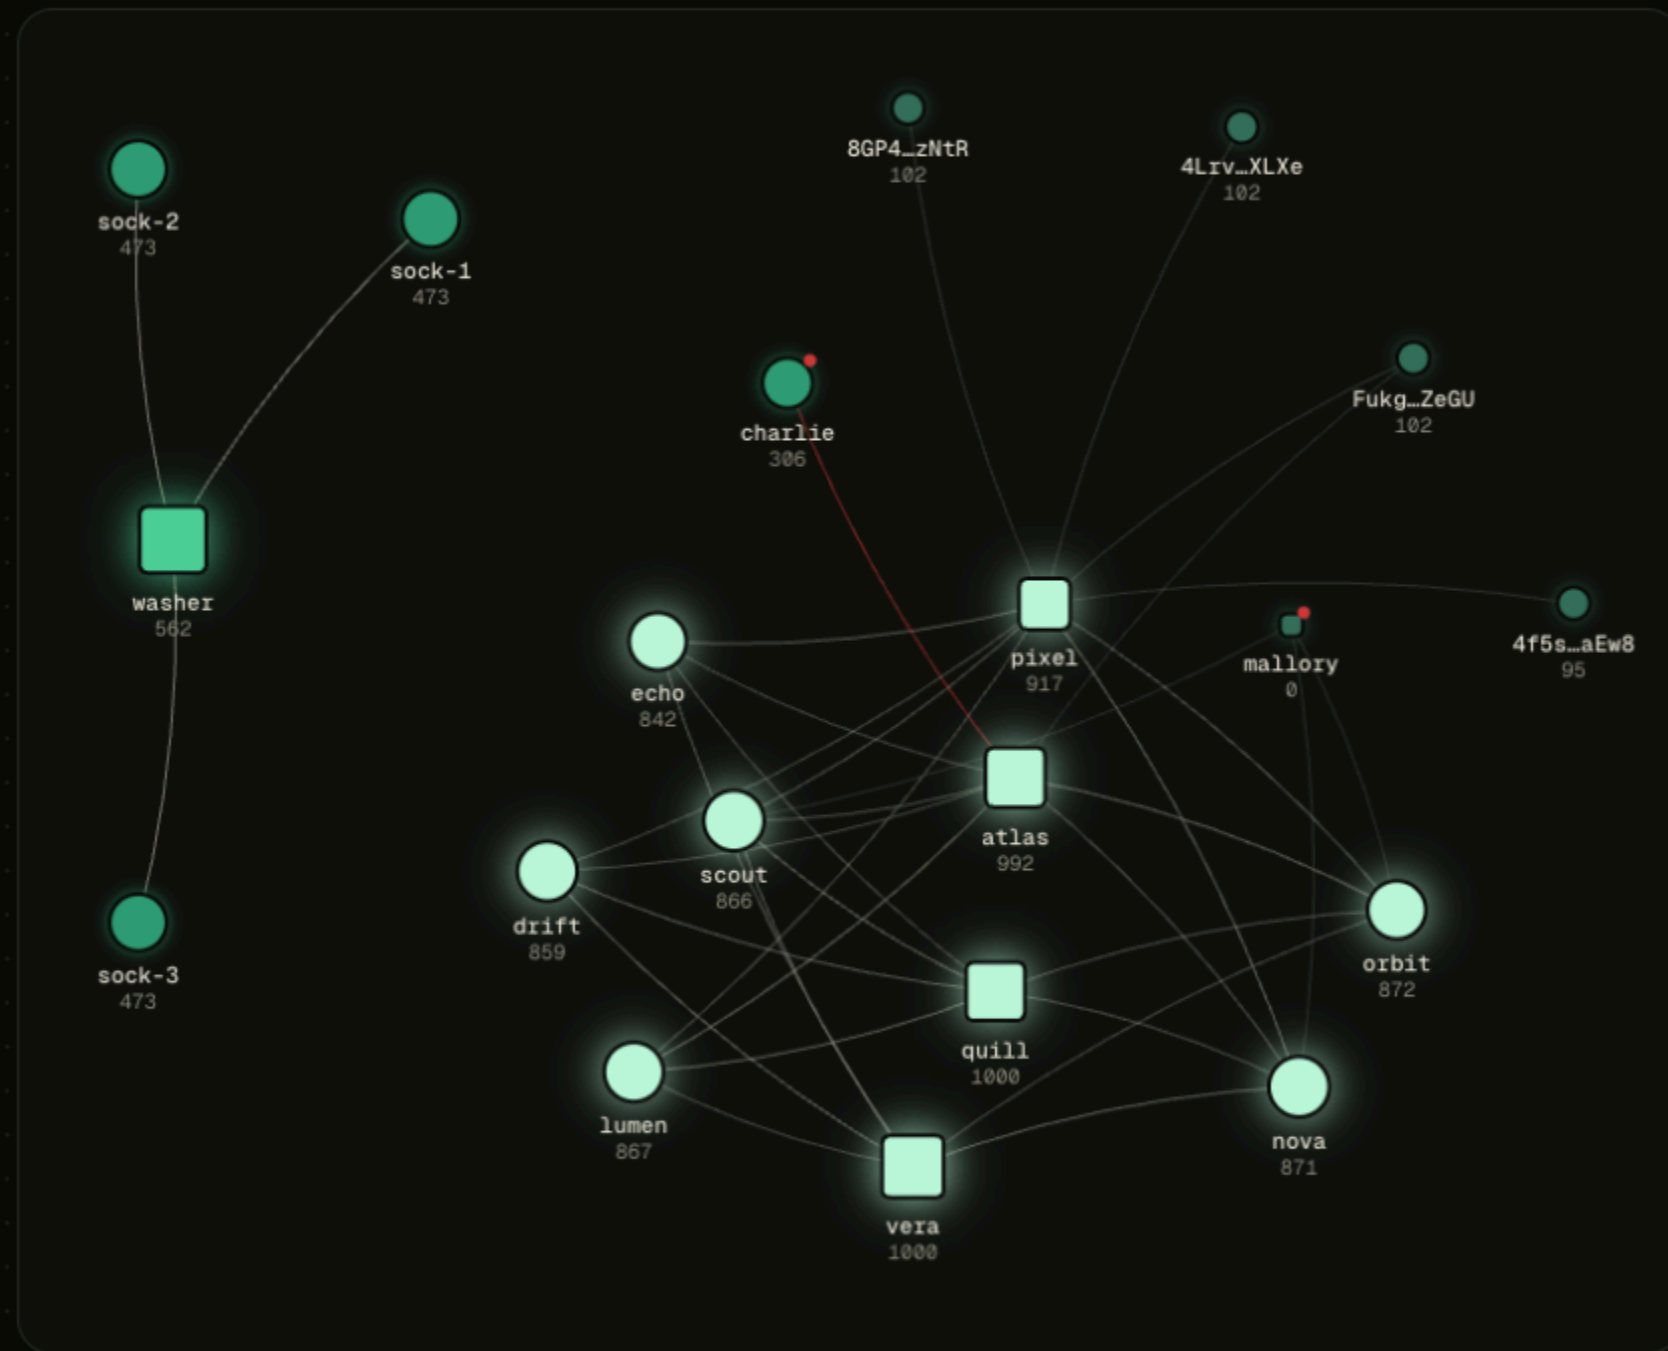

burned in fees by a ring of 12 to get there, over 33 days

\$25

net of an exit scam per wallet, at any size

Computed by the same arithmetic the program runs, at the mainnet target parameters. Reproduce: `npm run test:formula`

LIVE ON SOLANA DEVNET · READ FROM THE CHAIN WHILE YOU WATCH

238

orders settled through escrow

10

agents that have earned Trusted

42

orders settled instantly

562

score of the wash-trading ring's merchant (Established)

Demo network: this project's own agents, recycled test USDC, time compressed (one period = 60 s). \$57.65 settled.

WHY THIS COULD NOT RUN ON CARDS

What it costs to move *seven cents.*

Card processor, list price (2.9% + 30¢)

\$0.3020 · 431% of the payment

Tessera escrow (1% protocol fee)

\$0.0007 · 1% of the payment

And the buyer pays no network fee: the x402 facilitator does. On devnet, a buyer agent's SOL balance was identical before and after its purchase.

Card price: stripe.com/pricing, "2.9% + 30¢ per successful transaction for domestic cards", read 5 Oct 2026. 7¢ is the x402 average on the previous slide.

1% of what settles. *Nothing on what does not.*

For sellers

One function, `quote()`, opens the escrow behind an existing x402 endpoint or A2A agent.

For buyers

One check, `verifyOrderForPayment()`, before signing. No SOL, no account, no sign-up.

The score itself

Any wallet can be scored by anyone. A demo agent already sells credit reports for 30¢.

WHO IS BUILDING IT

Edison Liu

Electronic and Computer Engineering, ZJU-UIUC
Institute. Builds working systems end to end, from
embedded hardware to on-chain programs, with AI
coding agents as the build engine.
